Induratio penis plastica

The cause of Peyronie's disease/ IPP is not entirely clear. Microtraumas in the connective tissue layer with haemorrhages leading to scar tissue formation with or without calcification are postulated.

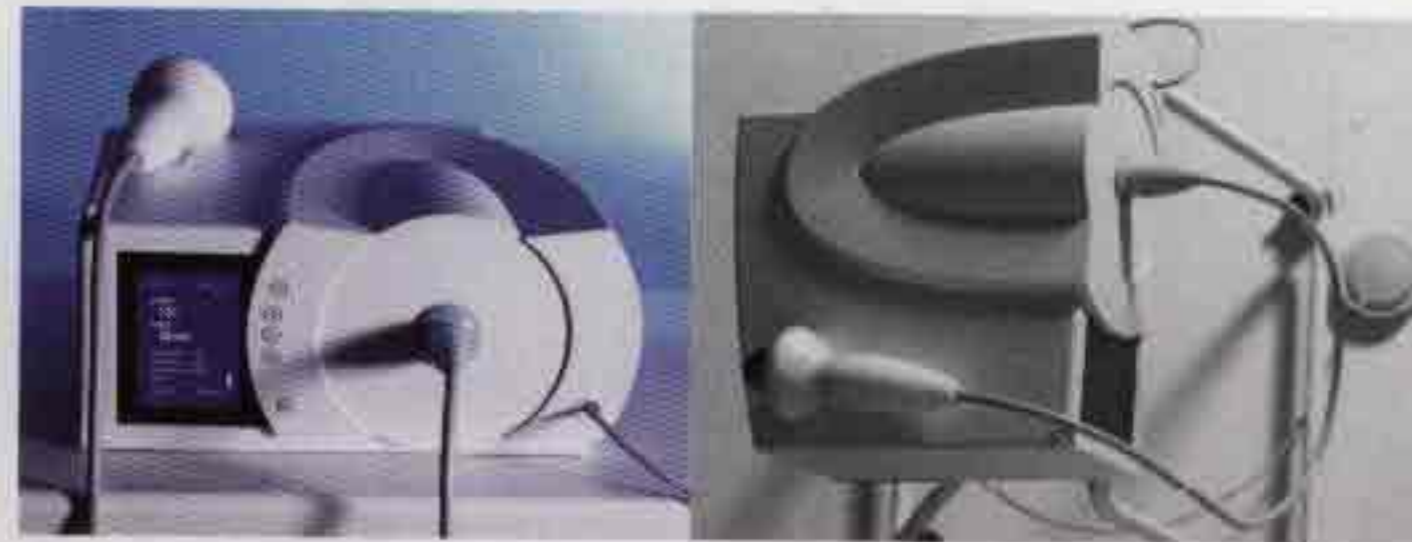

Therapy is divided between a conservative initial phase, which often fails to bring a satisfactory result and various surgical procedures, which are regarded to be effective but symptomatic.

Shock-wave therapy has been used with great success as a non-invasive therapeutic procedure in the treatment of induratio penis plastica in recent years.

Studies verify that extracorporeal shockwave therapy (ESWT) provides an anaesthesia-free therapeutic option with low side effects that shows clear treatment success.

High Medical Technologies (HMT) ranks among the leading group of developers and manufacturers of high-quality medical technology system solutions.

HMT specialises in the use of electrohydraulic shockwave therapy in urology, orthopaedics and veterinary medicine. HMT is the pioneer and driving force behind innovations in this technology, which is regarded as the "gold standard" in the field of lithotripsy.

EvoTron

The small, flexible shockwave device for use in urology

With the EvoTron, HMT has utilised the outstanding clinical results from urology for the development of a lightweight, portable shockwave device for the treatment of soft tissue in close proximity to bone.

Thanks to its wide focal range and reduced energy density the EvoTron is also particularly well suited for the treatment of IPP.

The EvoTron's hand-held therapy head can be flexibly positioned, thereby enabling optimal coverage of the area to be treated.

Shockwave therapy with the EvoTron – the safe treatment method for your patients.
